2. Active Sprint Board

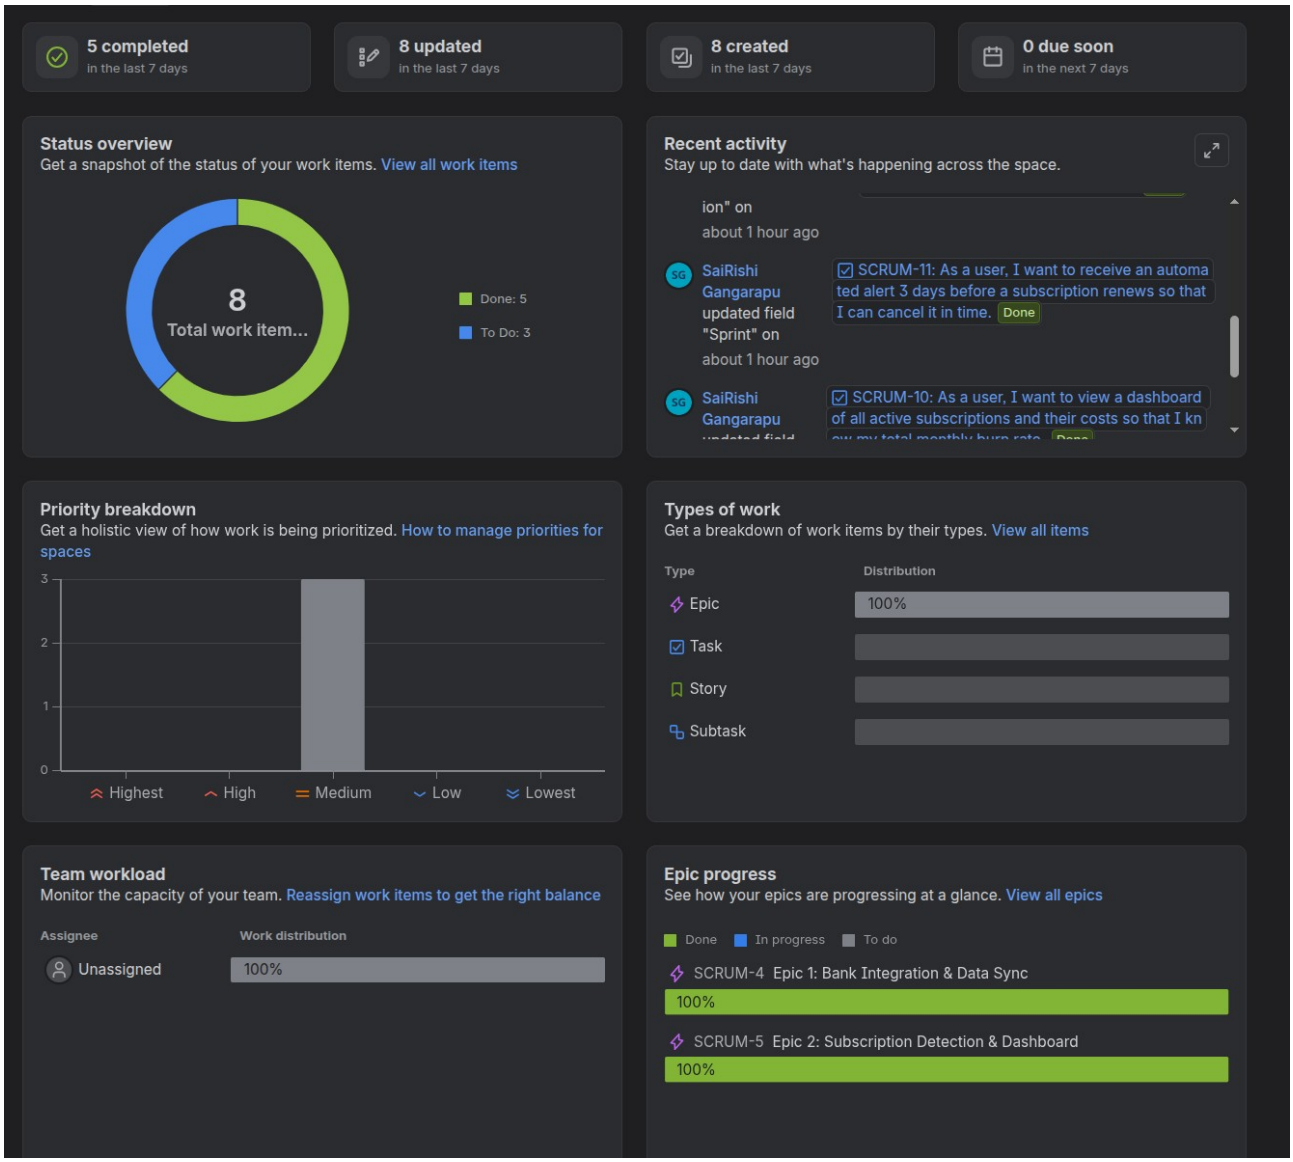

(The screenshot below shows the active Sprint 1 board, demonstrating how User Stories were transitioned through the To Do, In Progress, and Done columns during the sprint lifecycle).

3. Burndown Chart (Two Completed Sprints)

(The screenshot below displays the Burndown Chart generated after successfully completing the sprints, visualizing the burn rate of story points over time).

4. Reflection Answers

Q: How did story pointing help in sprint planning? Answer: Utilizing the Fibonacci sequence for story pointing allowed us to estimate the relative complexity, effort, and risk of tasks rather than guessing exact hours. For example, it highlighted that the secure API integration (8 points) was significantly more complex than building a simple UI dashboard (3 points). This prevented us from overcommitting in Sprint 1 and ensured we maintained a realistic velocity.

Q: What challenges were faced during the sprints and how were they resolved? Answer: A major challenge during Sprint 1 was managing the complexity of the bank integration API while adhering to strict security requirements (ensuring no cleartext credentials were stored). We resolved this by breaking the large Epic down into smaller, manageable user stories (e.g., separating the 90-day sync logic from the secure credential parser) and collaborating closely on the backend architecture to clear the bottleneck.

Q: How did the burndown chart reflect the team's progress? Answer: The burndown chart provided a clear visual representation of our work completion rate against the total committed story points. While there was a slight plateau at the beginning of the sprint as we researched the API documentation, the chart showed a sharp decline as we successfully moved the backend integration stories to "Done", ultimately allowing us to complete the sprint goals on time.
